Introduction

Introduction

My research question is: **How do resignation calls affect cabinet reallocations and dismissals of ministers in Latin American presidential democracies?**

I use a combination of a presidential **protection policy** and a **dismissal rule**: The president protects ministers subjected to a first questioning but, because they are then contaminated, the probability of ministerial termination increases as from a second call for their resignation.

- Archival review of press reports in 12 LA countries (mid-1970s-2021), compiling a dataset on ministerial turnover and resignation calls.
- Data mining (OCR) and machine learning and then a semiparametric approach of competing risks and PS matching.

Theory and Empirical Expectations

Protection Policy and Dismissal Rule

To limit agency problems, the president could apply a combination of protection policy and a dismissal rule, borrowed from the rules modelled for parliamentary systems by Dewan and Myatt (2007, 2010; see also Berlinski et al., 2010).

The protection policy considers that ministers can be: (1) **tainted** by having been affected by a scandal or (2) have a record **clean of questioning**.

- If a tainted minister is again affected by a scandal, dismissal should be highly probable (limiting moral hazard).
- A minister with a clean record should be protected by the principal to encourage political activism (limiting agency loss).

Protection Policy Expectation

The first resignation call should serve as a warning for the minister to improve their performance rather than as an immediate threat to their position. This protection policy should have two outcomes: the retention of the questioned ministers or their reallocation to a different portfolio.

Thus, my first hypothesis is:

- **Protection Policy Hypothesis.** The first call for a minister's resignation raises the probability of reallocation, but not of individual terminations.

Dismissal Rule Expectation

If ministers whose resignation has already been called for are involved in a new scandal, the president could activate the dismissal rule.

The dismissal of a tainted minister could operate as a positive signal in the chain of delegation between voters and the president ([Dewan and Dowding, 2005](#)). In addition, dismissing tainted ministers could be a way to limit moral hazard by demonstrating that officeholders' actions are not insulated from negative consequences. Accordingly, the empirical expectation is:

- **Dismissal Rule Hypothesis.** The second and subsequent calls for a minister's resignation raise the probability of individual terminations, but not of reallocations.

Moderation Analysis

I focus on tainted ministers and test the reliability of the dismissal rule under two conditions: **nonpartisanship** and **seniority** of ministers.

First, the appointment of nonpartisan ministers indeed operates as a strategy for dealing with the agency problems, such as agency loss, information asymmetries and moral hazard, that can occur when the agent is a partisan minister (Altman, 2000; González-Bustamante, 2022; Martínez-Gallardo and Schleiter, 2015).

Second, by appointing and protecting more technically skilled cabinet members, presidents should achieve good public policy outcomes and send positive signals to the electorate (electoral accountability literature; see for example Besley and Case, 2003).

Empirical Strategy

Cases and Data Gathering

I combined the Tesseract Optical Character Recognition (**OCR**; see [Ooms, 2021](#)) with different **semi-supervised machine learning models** to distinguish between resignation calls and other mentions of cabinet members in the press. This was applied to **46 years** of **Latin American Weekly Report (LAWR) archives**.

Detail of the Batches of LAWR Archives

Batch	Archives	Years	Format	Volume
Batch-01	LAWR-1975 to LAWR-1979 Including 1997	5	 CSV UTF-8	9.56 MB
Batch-02	LAWR-1980 to LAWR-1998 Excluding 1997 Including the first half of 2003	18.5	 PNG images	38.5 GB
Batch-03	LAWR-1999 to LAWR-2021 Excluding the first half of 2003	22.5	 PDF files	341 MB

Binarisation Techniques for Enhancing OCR

Note. The images correspond to a LAWR page before binarisation and after the application of the techniques of Sauvola and Pietikäinen (2000), Singh et al. (2011) and Su et al. (2010).

Tesseract Optical Character Recognition

The logo features the words "Latin American weekly report" in a bold, sans-serif font. The word "Latin" is in a smaller box above "American". The background is a black and white photograph of a newspaper masthead with the word "PENNSYLVANIA" and other text like "THE DAILY NEWS", "GROWTH IN EXHIBITION", and "ST. VITUS BAPTIST CHURCH".

How Domingo Cavallo rose to become Menem's virtual prime minister

Argentina are still hotly debating what lay behind the sudden resignations of President Fernando de la Rúa and his Foreign Minister, Ernesto González, and his replacement by Domingo Cavallo (UPI 8/1). The simple explanation—the dollarization of the economy—was dismissed as the cause because the dollar rate, as depressed as it was, had been established and maintained about all sorts of political considerations.

One thing seems certain: that González had been instrumental in the decision at Menem's insistence, and according to sources with access to him, that he knew President Carlos Menem wanted to do away with him. Indeed, a widely accepted version is that Menem had always intended to remove González from office, but had waited to do so until he could be sure he would be able to preside over the period of "activation" which he expected would follow the election of a new president.

In this scenario, as González did what he did to offend his own string, Menem proceeded to have him removed. He had already prepared a replacement, and had already arranged for the appointment of Cavallo. In short, the

It goes without saying that Menem's re-election was a resounding success. Capitalising on a series of economic successes, he had not bargained with the adverse popular perception of his predecessors, the leaders of the dirty war. The scandals, the accusations of corruption in the higher government, and the fact that, despite the scandals, the coup could not count on unanimous support from the South American armed forces, were seen as joining forces to bring him down. The departure of the last of the 'dirty' ministers, the Minister of Justice, Carlos Moreno, on 12 December, replaced Menem, the President of the Argentine Republic.

At this point, the scenario
is Cavallo bolstered
and ready to hang on. As a
general rule he has emerged, not
as a new economy minister,
but as a new economic
prime minister —

Cívica (UCR), on some
condition that would ensure
the stability of the government.
Alfonsin, in turn, argued that many prominent
politicians and businessmen,
35 diplomats, have been
imprisoned since late 1980. ■

Argentines are still hotly divided as to what lay behind the sudden resignation of economy minister Ernesto González, and his replacement by Domingo Cavallo (see p. 68). The unemployment, unsatisfactory dollar rate, is dismissed as irrelevant, and much has been published about all sorts of plots.

Another strand of interpretation holds that the change took place when Menem suddenly lost his confidence, shaken by a series of events he had not bargained for: the depth of adverse popular reaction to the economic policies he had adopted; the growing influence of the military leaders of the scandal-ridden corruption in the reaches of the government, as well as realization that, despite his successes, he could not count on sufficient political support from the administration.

This is at a time when even highly placed members of his government as Vice-President Arturo Duhau were seen as just the mouthpiece of the military leadership, deriving their authority from the presidency for weeks speculate has been made about which more constitutional procedures would find most favor.

It was at this point, the scenario goes, that Cavallito bolstered Menem's resolve to hang on. Since then, Cavallito has emerged only as the new economy minister, but as a virtual prime minister in all but name. He has been given key ministerial posts and even appointed his own people in other ministries. Cavallito, it is said, even won Senator Eduardo Menem, the President's brother, over to his cause. Carlos Menem's most trusted

Argentina are still what lay behind the nation of economy in Ernesto González byment by Domingo Cavallo. The model of a market-oriented dollar rate is, in short, reason and sense, and was published about all at once.

One thing seems González had seen him in the book of Menem, according to sources he, that he knew Pinochet would one indeed, a widely accepted that Menem had always appeared to him as a way to provide economic "moderation" which would follow a first "inflation". In this scenario did was to choose his

Another strand of the story is that the change to Menem suddenly gained confidence, shaken by events he had not been aware of. The depth of awareness of the situation was shown by the military leaders of the 1976 coup, who were widespread proponents of the government's realisation that, despite its faults, he could not be replaced by a civilian administration.

This is at a time when highly placed members of the armed forces, as Vice-President du Duhau was seen to be, were still supporting Menem's departure from the presidency for weeks after many constitutional procedures would have

The scenario bolstered by the press is that the government has been weakened by the minister's resignation. The president of the Senate, however, said even to his own party, as he has said, has been Eduardo Frei's brother, as well as his most trusted adviser.

Performance and Accuracy of the Tesseract OCR Algorithm

Accuracy is based on the proportion of text that was correctly identified.

This calculation was performed after extracting stop words and carried out with dictionaries trained with **Long Short-Term Memory (LSTM) models** used by Tesseract.

Semi-Supervised Approach

There are two significant **drawbacks** to training **supervised algorithms**:

1. This would have required a major amount of labelled text data (**time and resources**)
2. The accuracy of the algorithms is expected to decrease out-of-the-sample and over time
(batches of archives cover almost 50 years)

Therefore, I preferred a **semi-supervised approach** that could maintain a **high accuracy level over time with a small amount of coded data** for training (Lee et al., 2021).

1. I drew a subsample of 1,000 LAWR press releases
2. A team of human coders classified all these observations (**resignation calls**)
3. Labelling was conducted to generate ground-truth labels to cross-validate
4. Semi-supervised models using knowledge-based seed words

Semi-Supervised Approach

Labelling Process for Benchmarking Supervised Models

Coder	Labels	$M(T)$ Label	\sum Time	Consensus
1	966	39s	10h 25m	94.05
2	718	1m 15s	15h 0m	94.84
3	704	38s	7h 29m	94.82
4	318	1m 4s	5h 38m	95.47
5	263	17s	1h 14m	99.26
6	101	1m 17s	2h 9m	88.50

Note. Each observation was hand-coded by three different coders. 2.3% of observations were revised and relabelled during an iteration step. Seed words coincide with features extracted from the benchmarking supervised models trained based on this labelling process.

Goodness-of-Prediction of the Semi-Supervised Models

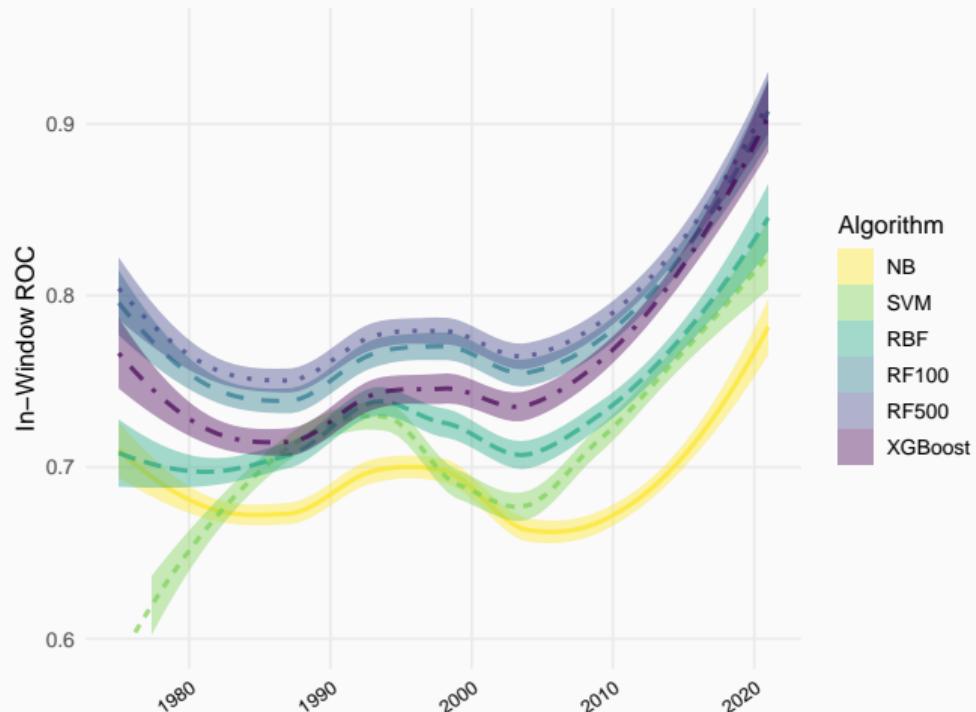

Model	Knowledge-Based Seed Words				
	Accuracy	Precision	Recall	F1-score	ROC
Naïve Bayes	0.713	0.734	0.948	0.828	0.638
Kernel Linear SVM	0.698	0.741	0.900	0.812	0.614
Kernel Gaussian RBF SVM	0.726	0.728	0.995	0.840	0.647
Random Forest (100 trees)	0.743	0.742	0.991	0.849	0.671
Random Forest (500 trees)	0.743	0.740	0.997	0.849	0.682
XGBoost	0.726	0.762	0.905	0.827	0.660

Note. The evaluation was performed with resampling methods using the testing set and 10-fold cross-validation.

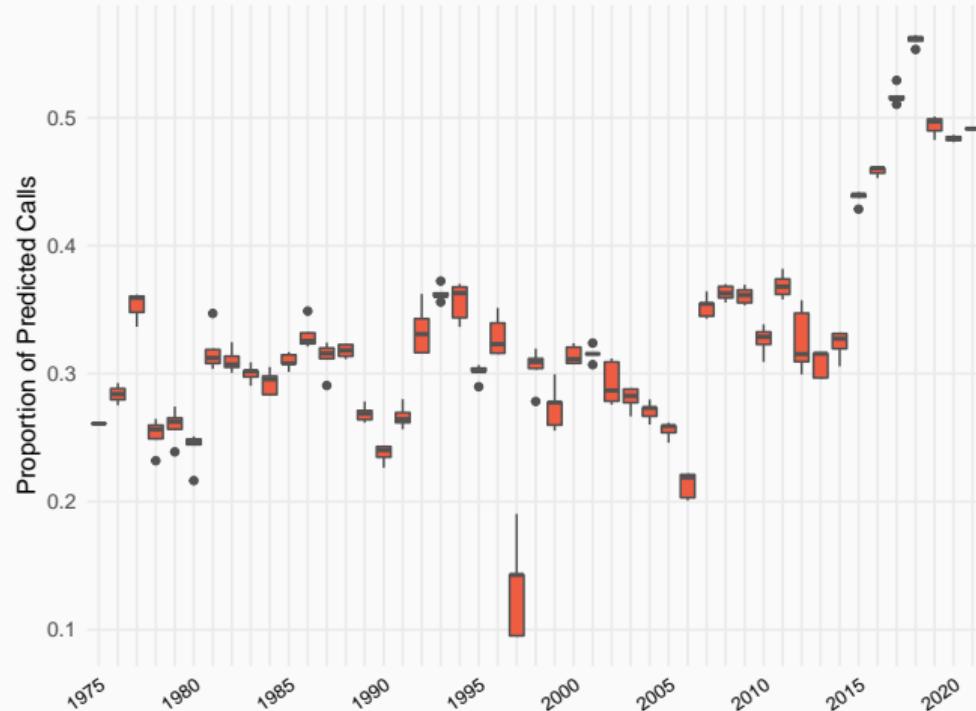

Goodness-of-Prediction of Semisupervised Models (1975-2021)

Following Greene et al. (2019), I trained semi-supervised models using a **five-year fixed rolling window** from 1975 to 2021 to train algorithms and predict resignation calls.

Random Forest classifiers with 500 trees 10-fold cross-validated.

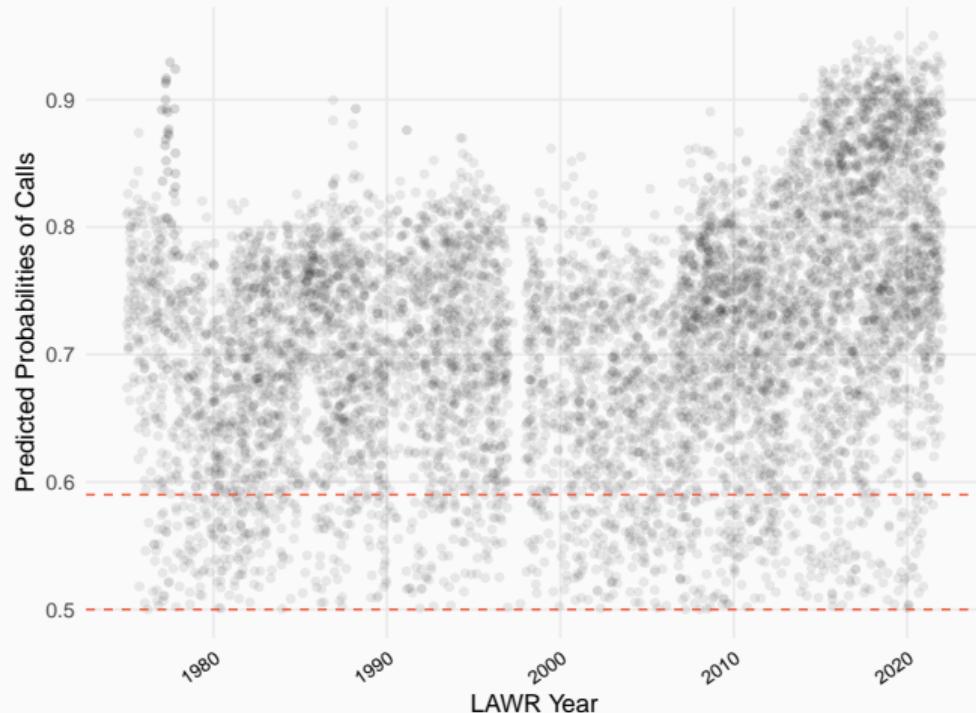

Predicted Ministerial Resignation Calls over Cabinet Press Mentions

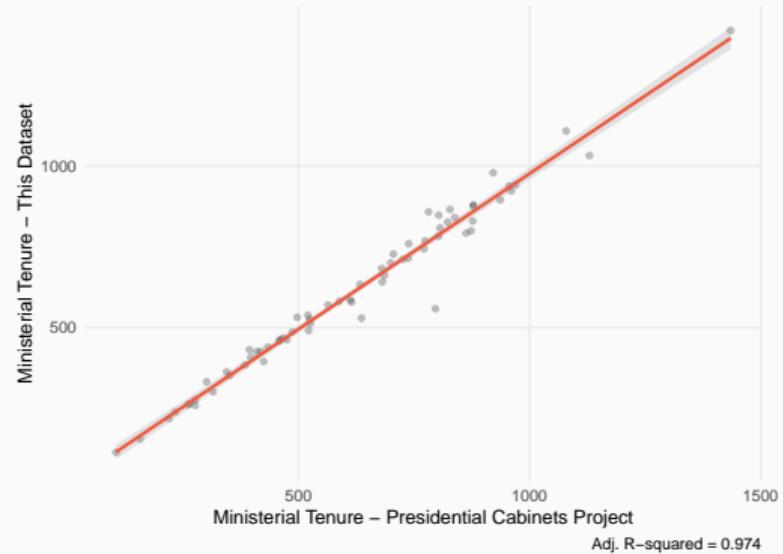

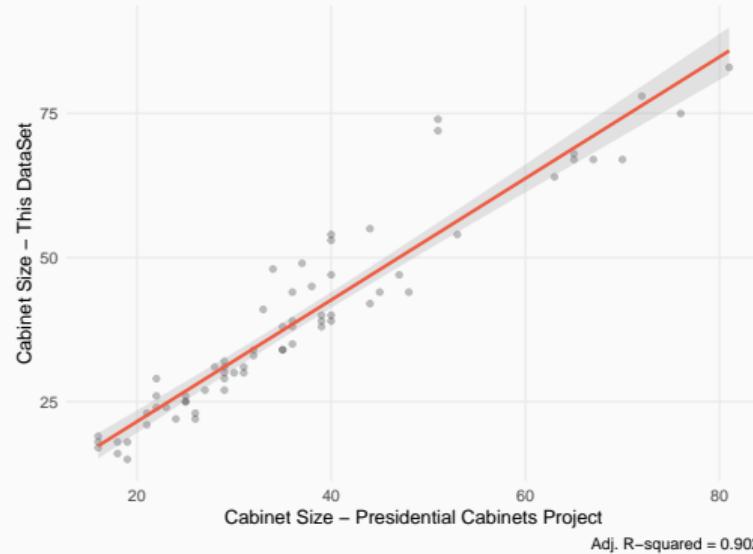

Proportion of predicted resignation calls over mentions of cabinet members in press reports, were carried out with an **ensemble semi-supervised RF500 algorithm**.

Augmented Artificial Intelligence (A2I)

I performed an augmented artificial intelligence process based on a **human review** of the predicted observations with low confidence values to improve the data's quality.

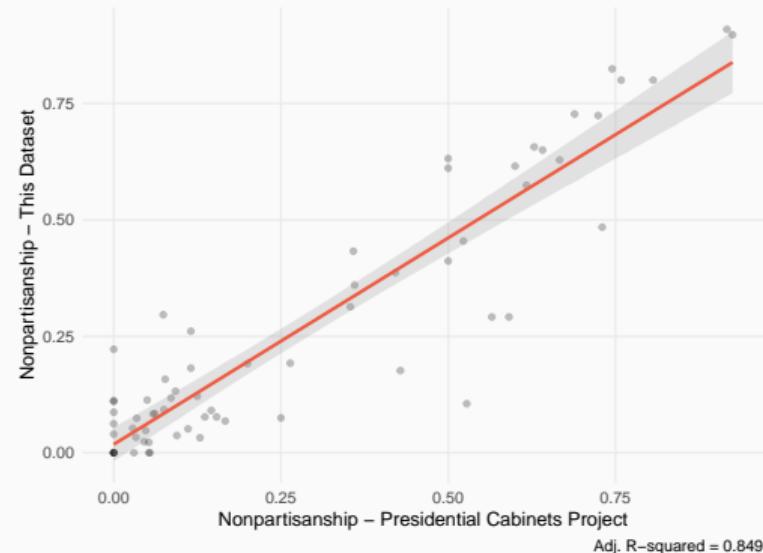

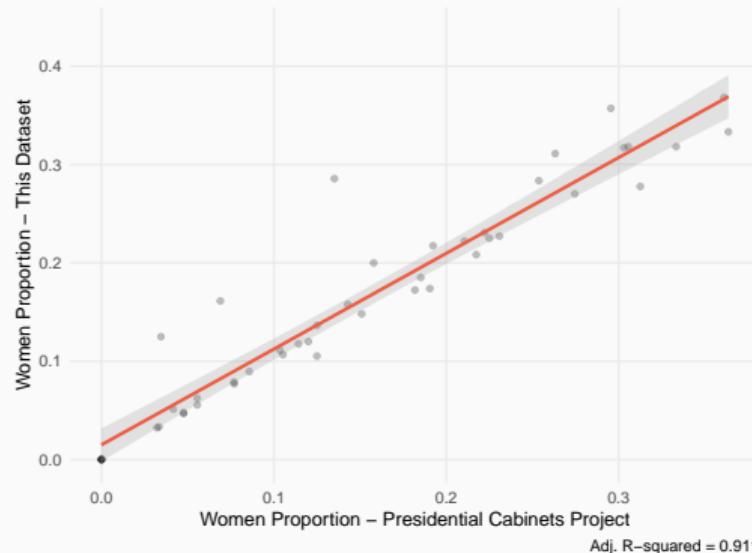

Convergent Validation against Similar Datasets

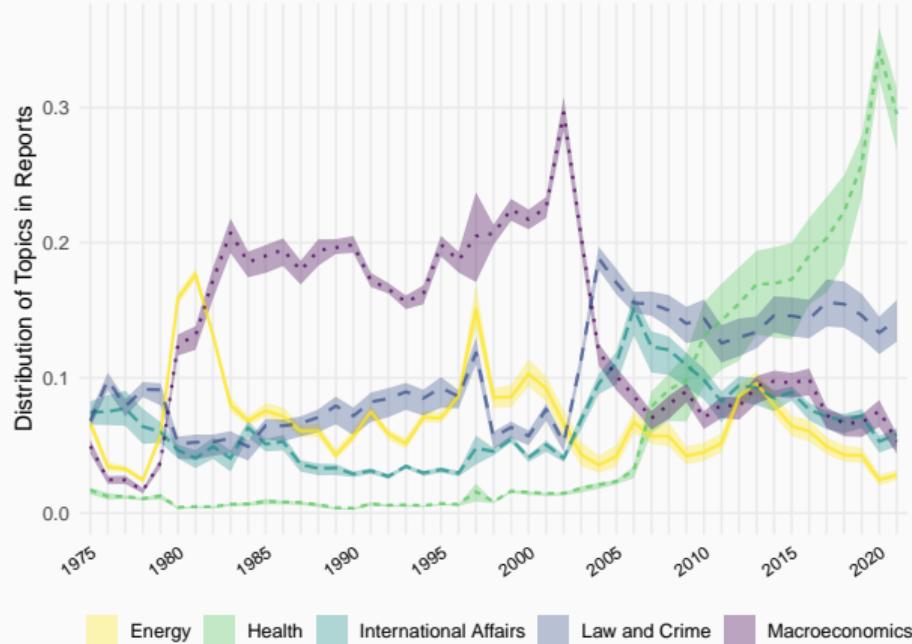

Note. Concurrent presidential terms were used for comparisons with the Presidential Cabinet Project (see Camerlo and Martínez-Gallardo, 2020).

Convergent Validation against Similar Datasets

Note. Concurrent presidential terms were used for comparisons with the Presidential Cabinet Project (see Camerlo and Martínez-Gallardo, 2020).

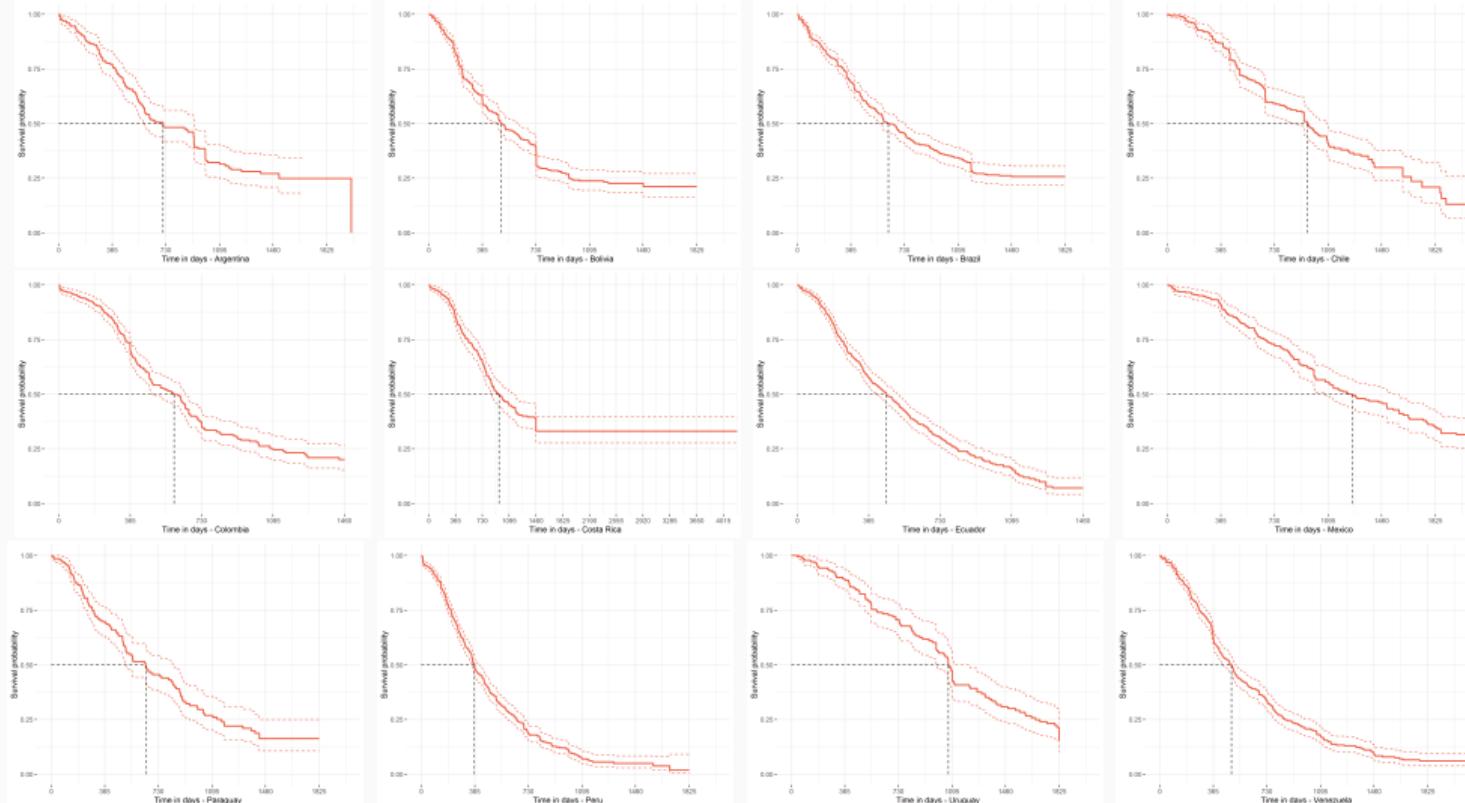

Content Validation: Major Agenda Topics in Latin America

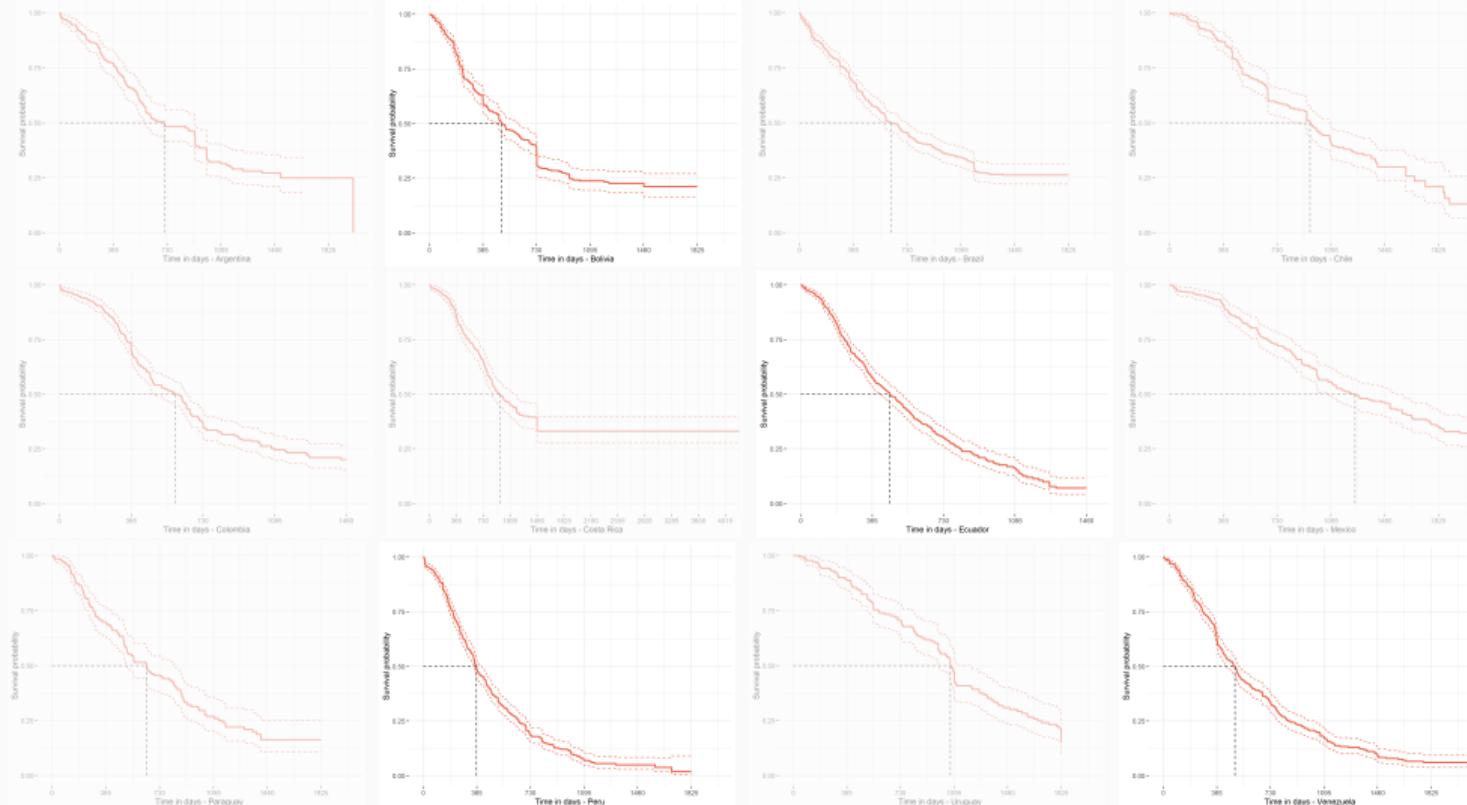

I used Keyword Assisted Topic Modelling (key-ATM; see Eshima et al., 2022) and a dictionary based on Comparative Agendas Project (2022).

It is a semi-supervised Bayesian application that allows me to obtain θ (distribution of topics in the documents and Cls).

Kaplan-Meier Survival Estimations in 12 Presidential Cabinets

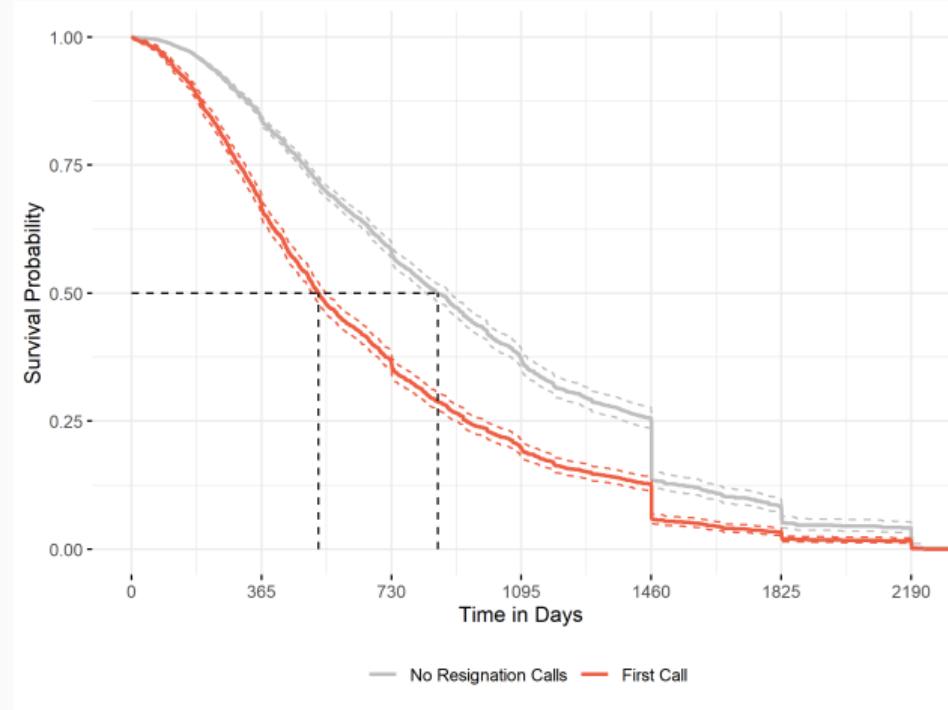

Kaplan-Meier Survival Estimations in 12 Presidential Cabinets

Kaplan-Meier Survival Estimation

$F(t) = 1 - S(t) = \Pr(T \leq t)$ can be used to obtain the incidence of ministerial exits during T by considering $S(t)$ as a survival function, if raw exit is considered an event in the **absence of competing risks**.

Time-Dependent Data Encoding

The dataset was **time-dependent encoded** using monthly intervals with the (start, stop] model (Therneau et al., 2020). This allowed us to incorporate **time-varying covariates**.

We observe the time events T considering monthly intervals and k -th **competing risks** $Y_{k[i]}$ for **reallocations** ($k = 1$) and **individual ministerial terminations** ($k = 2$) by constructing the monthly intervals $Z(t) = I(t > Y_{k[i]})$.

I then used the closed interval of i -th observations (officeholders) as an endpoint in a function for multi-state survival variables obtaining an outcome dataset to control competing risks with **Fine-Gray weights** (Fine and Gray, 1999; Therneau et al., 2022).

Propensity Score and NNM

I distinguish $D_{j[i]}$ as **1st resignation call** ($j = 1$) and the **2nd or subsequent ones** ($j = 2$). Consequently, I regress $D_{j[i]}$ on a vector of covariates and potential confounders $X_{m[i]}$ that considers quadratic presidential term patterns dummies and type of ministry, using probit models.

I also incorporated country FE and Fine-Gray weights w_1 . This is our **naive propensity score estimation**:

$$D_{j[i]} = \varphi \left[\alpha + \sum_{m=1}^M \gamma_m w_{1[i]} X_{m[i]} + \zeta w_{1[i]} \text{country}_i + \varepsilon_i \right] \quad (1)$$

Propensity Score and NNM

Then, I expanded our PS estimation by incorporating **additional confounders** to $X_{m[i]}$ to **block the backdoor path**. I favour the incorporation of covariates that can affect the presidential decision (protect/dismiss), as well as calls:

- Presidential leverage (control of the relevant Houses)
- Opposition fragmentation*
- Government fragmentation*
- Government type (single-party vs. coalition)
- Presidential re-election
- Cumulative level of resignation calls**

* probability that two randomly selected deputies belong to different parties.

** to improve precision since it could be a competing exposure rather than a confounder.

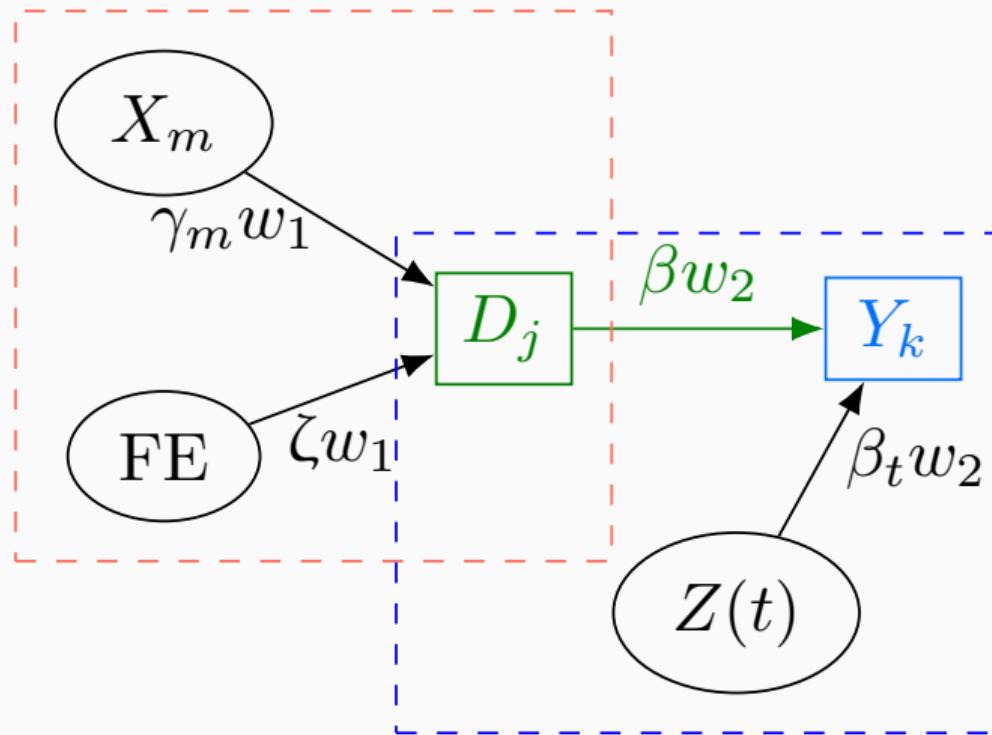

Competing Risks Models

After matching, the outcome analyses were carried out in the different matched samples with Fine-Gray subdistribution hazard models to estimate the **ATT for observational studies**, that is, the effect on ministers who received resignation calls.

The models regressed $Y_{k[i]}$, where $k = 1$ for **reallocations** and $k = 2$ for **dismissals**, on resignation calls indicators $D_{j[i]}$, using PS weights w_2 and $Z(t)$ intervals:

$$\lambda_k(t_i) = \lambda_{0[k]}(t_i) \exp \left[\beta_t w_{2[i]} Z_i(t) + \beta w_{2[i]} D_{j[i]} + \varepsilon_i \right] \quad (2)$$

* $p < 0.1$; ** $p < 0.05$; *** $p < 0.01$

I reject the **Protection Policy Hypothesis** as there is no evidence to suggest that the first call alone increases the probability of a minister being repositioned.

Although we reject this hypothesis, we found (novel empirical) evidence that reallocations and individual terminations are competing risks at the early stage of public questioning.

Estimating the Dismissal Rule

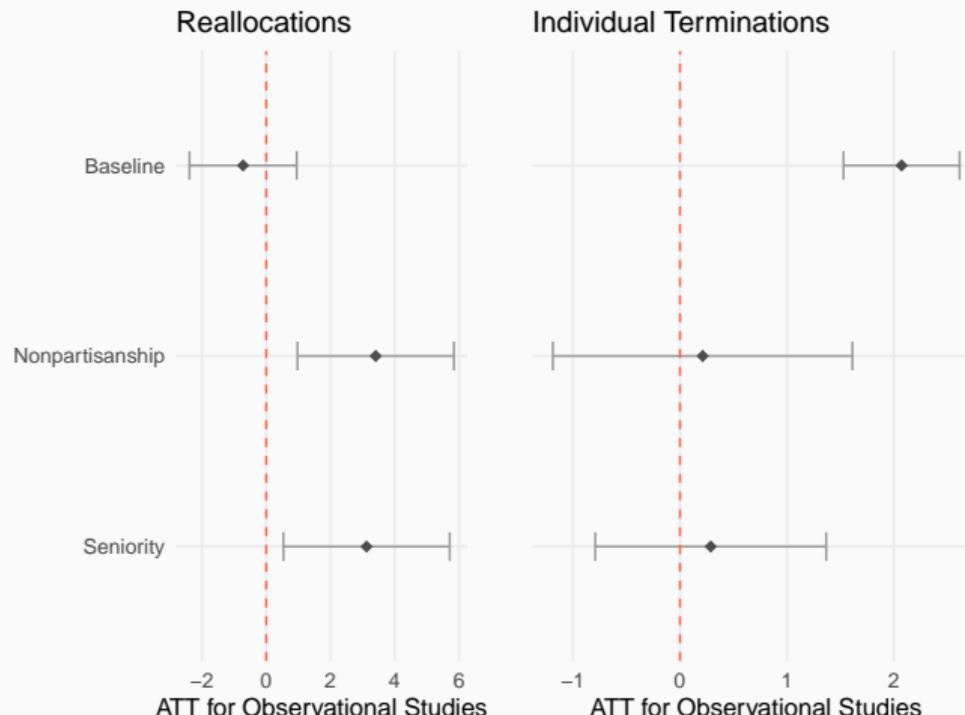

Model IV with the block of confounders has an estimated ATT of 2.073. This implies the risk of a minister's removal increases eightfold.

These results confirm the **Dismissal Rule Hypothesis**.

	Reallocations		Ind. Terminations	
	Model I	Model II	Model III	Model IV
Second or subsequent resignation calls	1.099 (0.744)	-0.729 (0.851)	1.329*** (0.283)	2.073*** (0.277)

* $p < 0.1$; ** $p < 0.05$; *** $p < 0.01$

Moderation Analysis

The effect of resignation calls on the probability of reallocation is more substantial.

The estimated effects are not significant for individual termination in the case of non-partisanship ($p = 0.766$) or seniority ($p = 0.602$), confirming a protection strategy.

Placebo Models

I repeated the primary models with resignation calls altered $\tilde{D}_{j[i]}$ with the aim of applying a placebo test.

The **absence of a significant ATT** in most models tends to confirm the main results.

	Reallocations		Ind. Terminations	
	Model I	Model II	Model III	Model IV

Robustness Checks

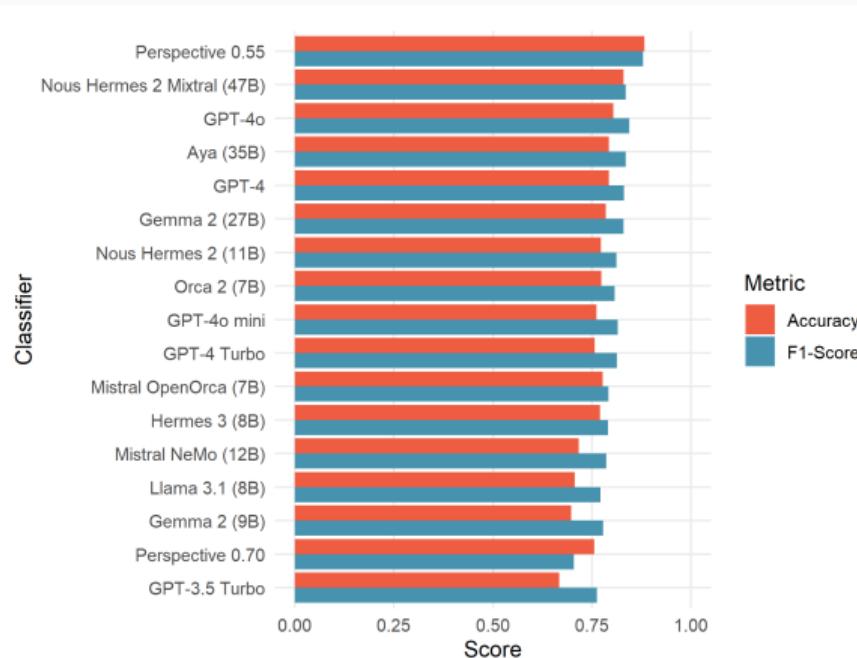

- ✓ The robustness checks using **additional confounders**, an **alternative matching algorithm** (caliper) and a **special standard error estimator** (Austin and Fine, 2019) show the same patterns as the main analyses.
- ✓ When incorporating macroeconomic indicators, presidential approval and controlling for low levels of freedom of speech as potential confounders, the results were not altered (**low residual confounding**).
- ✓ The exclusion of these **stochastic events** was made because I gave priority to the use of **resignation calls** as a noisy but empirically efficient indicator.

Takeaways and Future Work

Takeaways

- ☑ I offer novel indicators such as **reallocations** and **resignation calls**. In addition, the use of semi-supervised ML models is also an innovation.
- ☑ The theoretical argument is simple: The president protects her ministers in the face of an initial questioning by reallocating them to a new ministry but removes them from the cabinet in the face of further resignation calls. **In a nutshell, it is like in the football.**
- ☑ Combining semiparametric competing risks models and propensity score contributes to tackling the **non-random selection problem** in observational data.
- ☑ The risk of ministerial terminations increases **eightfold** from the second call, but it is **moderated** in the case of nonpartisan and senior ministers.

Future Work: LLMs Classification

Perspective API using a laxer threshold, **GPT-4o**, and **Nous Hermes 2 Mixtral** outperform other LLM's zero-shot classification annotation for toxicity.

New avenues. More complex classifications (few-shot or chain-of-thought) and the use of synthetic data.
